

Stretch wrapping line

Stretch bander

SB 500 NF
In line feeding system

Packaging machine suitable for integration in high speed production lines (up to 200 pieces/min.). This machine has been provided with non stop stacker cycle by the use of a retracting pusher system.

Stretch bander

SB 500 AU 90°
90° feeding system

Packaging machine with extremely versatile feeding system that allows automatic accumulation of packages on several rows provided with stacker (up to 100 pieces/min.).

Stretch bander

SB 500

The new line of L.P. PACKAGING machines, model SB 500 has been designed as flexible, versatile and reliable.

Perfectly suited for integration in high speed production lines.

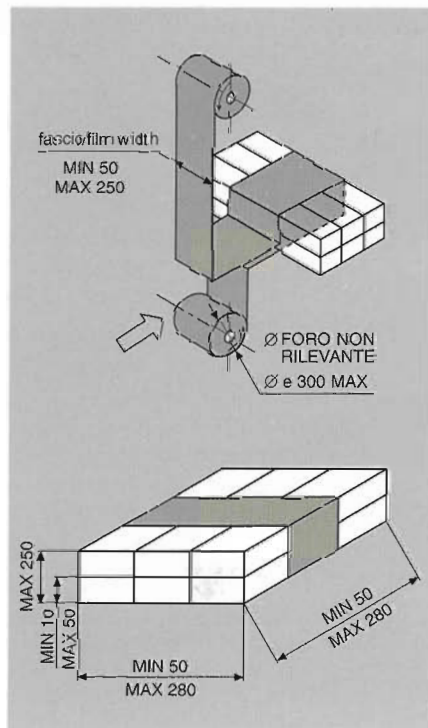

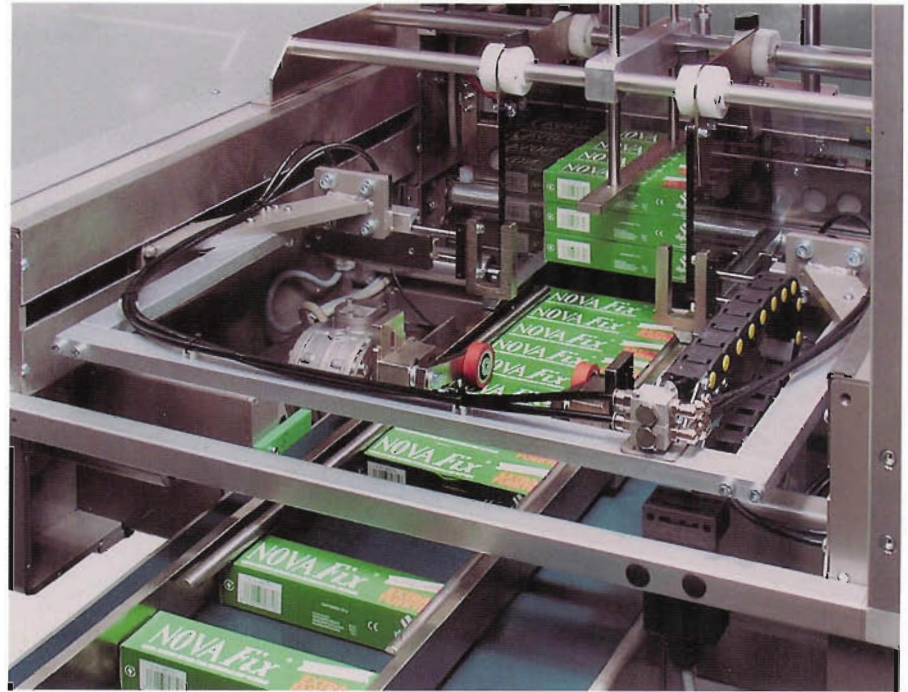

The feeding system is supplied with a stacking station to give multi layer packages. The machine is made to wrap using extendible film (stretch bander).

A stretchable band eliminates the need to use a heat shrink tunnel.

The products are pushed on a stacking table which assembles the package in front of the pusher.

The band is then gradually stretched around the package by an adjustable braking system to ensure perfect stability and strength of the bundle.

Available with 90° and frontal feeding system, the new SB 500 is provided with control panel that permits a wide range of settings to satisfy any packaging requirements and to guarantee high production.
